

SAE – Automation, s.r.o. Nová
Dubnica
Solid And Effective partner at
development of your products and
industrial automation

Energy Consumption monitoring and analysis

For whom is it dedicated

- Energy and facility managers
- Integrator companies

How it can be useful for energy and facility managers

- Overview of the actual energy consumption
- Overview of the historical data
- Cost information
- Tools to analyze consumption and costs
- Predictions of the consumption and costs
- Reporting in different formats, for different time spans, their management and printing
- Sending of alarms for defined conditions by E-mail or over SMS
- Comparing of consumption on different places
- Comparing of actual consumption with average and maximal consumption for different time ranges
- Archiving of the maximal and average values daily, weekly, monthly and yearly as well as for every week day
- Defining of tariffs
- Access to data in LAN and over Internet
- Numerical and graphical data views

- Grouping of data according to the different criteria
- Back up of the configurable data
- Binary values views
- Visualisation according to the place and a consumption type
- Analytical functions preconfigured according to the your needs
 - on line – according to the data saved in system
 - off line – according to the backed up data and reports in MS Excel™ format. Many different numerical and graphical data views
- Fast solving of your specific requirements
- Extensive basic functionality in fixed price
- Budget-priced accommodation to your specific requirements
- Possibility to monitor an energy consumption from renewable and unconventional energy sources
- Tree view structure of the actual and historical data view. We create this structure for you. You can make its changing and modification also yourself, if you like.
- Optionally, DDE communication with different applications, e.g. with MS Excel

How it can be used by integrator companies

- Connecting of energy meters communicating with whatever communication protocol – independence on hardware vendor
- Laborious programming is replaced by configuring and parametrizing
- High flexibility – you can program your own configurable modules – enhancing of the base system according to your needs. Except of configurable database commands, you can use also SQL to provide more complex database functionality.
- Enhancing of standard visualisation - standard data views, an application specific visualisation using whatever HTML editor.

- You can use own visualisation software, e.g. MS Excel™, MS Visio™, MS Silverlight™ and others communicating over OPC, web services or DDE and even using different proprietary communication protocols.
- Possibility to optimize by partitioning of on-line analytical functions between application for data collection and handling and the visualisation application.
- Efficient tool using MS Excel to configure different off line analytical functions

Object of delivery

- For energy and facility managers
 - completed software application providing the data collecting, handling and the visualisation accommodated to concrete requirements, taking into account points of supply, their placing, used energy meters and communication protocols
 - licences for base software
 - for data collecting and handling
 - licence for an efficient off line analysis software tool
 - to the communication drivers specific for connected energy meters
 - documentation to the base software
 - application specific documentation
- For the integrator companies
 - **Developer's** licences for base software
 - for data collecting and handling
 - visualisation web application
 - visualisation desktop application
 - licence for efficient software tool for off line analysis
 - budget priced **licences to the base software for using by end customers**

- documentation to the base software

Support

- For energy and facility managers
 - by parameterization of the system
 - by creation of off-line analysis
 - support service according to the dedicated service agreement
- For integrator companies
 - by parameterization of the system
 - by programming of own configurable modules
 - overtaking of the some new parts development of the system according to your requirements
 - By visualization application development
 - Pre-paid packages of the software support

SAEAUT EnergyMA components

The package consists of our next standard products:

- OpcDbGateway™ for data collecting and handling
- SAEAUT OPCWebExplorer™ for visualisation over Internet and intranet
- OPCAdapter™ for easy visualisation in LAN.

These products are preconfigured for a standard monitoring and on-line analysis of the energy costs. Energy meters are connected to the system most often over OPC servers from other vendors, or by communication drivers programmed such a way to be able to use them as additional configurable modules for OpcDbGateway™. Extensive off line analysis can be done using software tool Energy Lens™ running within MS Excel.
